This object class creates an empty game object and adds a prefab. The prefab comes from the Editor. I want to change the position of an object in the editor without moving it in the main class. The object is called blip The code in the editor is: using UnityEngine; using System.Collections; using System.Collections.Generic; public class SpawnObject : MonoBehaviour { public GameObject obj; public GameObject prefab; public void Spawn() { // instantiate it in the scene // Instantiate a prefab game object and assign it to a prefab Instantiate(prefab, obj.transform.position, obj.transform.rotation); obj.transform.position = new Vector2(5,5); } } In the main class I added the following: public void SetPosition() { // I want to change the position of obj in the Editor without changing it in the main // class. // I'm thinking something like obj.transform.position = new Vector2(5,5) } The main class: public class MainMenu : MonoBehaviour { public 2edc1e01e8

## MySQL Shell [Latest] 2022

MySQL Shell is part of the MySQL Server package. When the client package ( `mysql-client` ) is installed, you also have MySQL Shell. In contrast, the MySQL Shell client package ( `mysqsh` ) is a separate download. When you have MySQL Shell client installed, you don't have MySQL Shell in your MySQL Server installation. Further details For a full description of the MySQL Shell program, see the documentation. When you install MySQL Shell, you also install two supporting files: `mysqshrc` and `mysqshout`. These files are in the `/etc` directory of the server instance. System variables Below are some of the most important system variables and their values. To modify them, use the "env" command.

**SYS\_HOME** The directory where MySQL Shell is installed. If you set it to a different directory, you must also set its value in the environment variable `SYS_HOME`.

**SYS\_COMPILED** The value of the environment variable `SYS_COMPILED`. If you set it to 1, the MySQL Shell code has been compiled. If you set it to 0, the MySQL Shell code is only interpreted.

**DEBUG** The value of the environment variable `DEBUG`. If set to 1, the output of some statements is displayed in messages as they are executed.

**MYSQL\_HOME** The directory where the MySQL Server package is installed. If you set this variable, you must also set the value of `SYS_HOME` to the same directory.

**MYSQSHRC** The directory where the MySQL Shell client package is installed. If you set this variable, you must also set the value of `SYS_HOME` to the same directory.

**PYTHON\_HOME** The directory where the Python interpreter resides. If you set this variable, you must also set the value of `SYS_HOME` to the same directory.

**PYTHON\_SHELL** The directory where the Python interpreter resides. If you set this variable, you must also set the value of `SYS_HOME` to the same directory.

**PYTHON\_SHELL\_PATH** The directory where the Python interpreter resides. If you set this variable, you must also set the value of `SYS_HOME` to the same directory.
